Features

• Transimpedance Gain adjustable from $10^3$V/A to $10^8$V/A
• Additional AC coupled gain stage from 1 to 1000
• Separate AC and DC coupled outputs
• Customer specified photodiode options
• Low NEP at maximum Gain
• Bandwidth from DC up to 1MHz
• CW input power 0.75pW - 2mW
• Internal rechargeable batteries for low noise and high sensitivity

Product description

The high gain and low noise equivalent power (NEP) of the LNP2-A photoreceiver guarantees a very high sensitivity front-end for optical systems and provides separate AC and DC coupled outputs. These characteristics ensure that this photoreceiver is particularly suitable for experiments with low optical power levels, though it can be equally well employed for CW input optical powers up to 2mW. Other applications include direct detection, feedback control systems and lock-in detection.

The feedback resistance of the transimpedance amplifier can be switched over the range 1kΩ to 100MΩ, and each gain setting is optimised to provide maximum bandwidth while minimising ringing by keeping the overshoot to less than 5%. This yields a transimpedance gain which can be increased in decade increments from $10^3$V/A to $10^8$V/A. The DC output is taken immediately after the transimpedance gain stage, while the AC output can be independently boosted by the additional adjustable 1 to 1000 gain multiplier stage following the preamplifier. This can be selected in 2-5-10 steps which matches the increment between the scales of most standard oscilloscopes. The resultant DC and AC coupled outputs are available via separate front panel BNC output connectors.

The LNP2-A may be powered by its two internal rechargeable NiCd batteries (for lowest noise operation at frequencies below 500Hz), or by an
external ±15V supply, via the DIN connector supplied. The internal batteries are trickle charged whenever the external supply is connected. We recommend our compact LVPSU-1 ±15V DC Power Supply which can power up to six of the LNP2-A photoreceivers.

Customised versions of the LNP2-A units with a larger or smaller area photodiode, post mounted photodiode for free space systems, 19" rack mounted modules, etc. are available. Characteristic parameters of these photoreceivers (e.g. bandwidth, gain) can also be adjusted to suit your specific needs. We are also pleased to consider designing and producing OEM versions of the LNP2-series to integrate into your systems, so please contact OPTOSCI to discuss your individual requirements.

Options

- Alternative connectorised detector mounted on the front panel: FC, SC, ST, FSMA
- Larger or smaller area photodiodes
- Post mounted photodiode
- Customised performance characteristics e.g. reduced bandwidth with no gain peaking, increased bandwidth (x2) with 16% overshoot.

Low Voltage Power Supply

LVPSU-1

Features

- Six ±15V DC outputs from standard DIN sockets
- 1A maximum output current
- Designed for use with up to six LNP2-A photoreceivers or as a standard laboratory ±15V power supply.
- Compact bench top unit

Product description

The LVPSU-1 is a mains-powered ±15V DC power supply intended for use with up to six of OPTOSCI’s LNP2-A photoreceivers. It can also be utilised for standard laboratory applications requiring ±15V supply lines. The ±15V DC output is available from six separate front panel DIN sockets which match the DIN cables supplied with the LNP2-A photoreceivers. The maximum total output current of the unit is internally limited to 1A to prevent damage if a load draws excessive current.

The standard Power Supply is either a 120V or 240V AC mains powered unit with an IEC connector. The power supply can also be customised to allow the mains supply to be switched between 240V and 120V.
